OUTPUT REPORT

ATTENTION TEST

Mia Brown

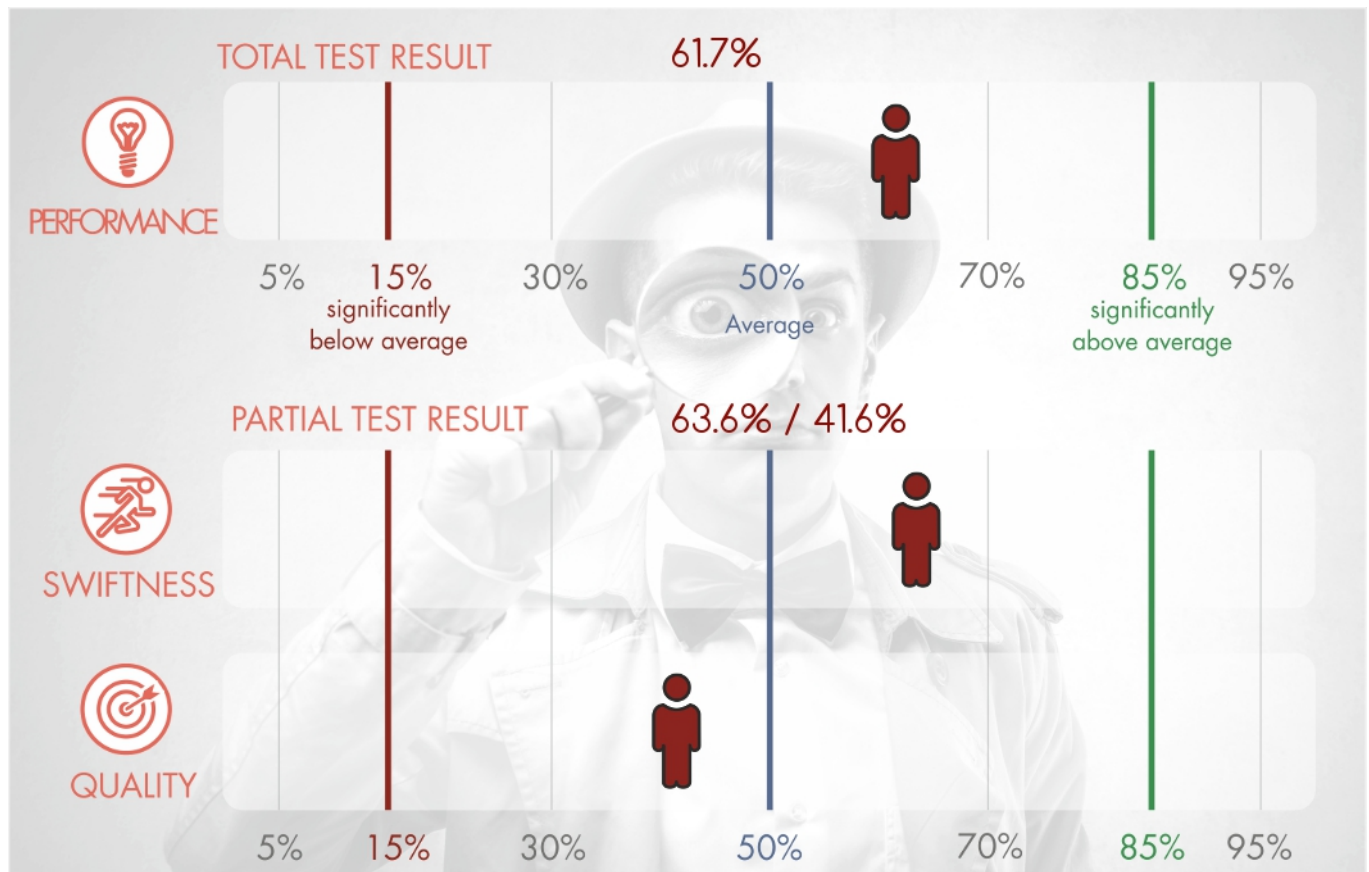

mia.brown@example.com

July 18, 2016

You now hold in your hands a report from Attention Test, which measures predispositions for good concentration of attention, especially in the situation of one repeated task under time pressure. Results from this test are an evaluation of overall success in this test, a comparison with a reference group in both speed and quality of solutions and a comparison of success across three subtests.

TOTAL RESULT OF THE TEST

The test outcome comprises evaluation of the overall success in the test and also comparison of the speed and quality of problem-solving with the reference group.

Note: The chart shows results of the test in the form of attained percentiles. Percentiles enable comparison with the referential group and show how many percent of people attained a worse result in the same test. The value of 50% represents an average result, the range from 30% to 70% is considered as the wider average zone. The referential group comprises the working population with at least secondary-school education and does not correspond with the general population.

The PERFORMANCE scale describes the overall result of each respondent in the test, i.e. how many tasks he/she resolved correctly in the given time limit.

The SWIFTNESS scale describes how many tasks the respondent managed to resolve in the given time limit, regardless of their correctness.

The QUALITY scale describes the portion of correctly resolved tasks compared to all tasks resolved by the respondent.

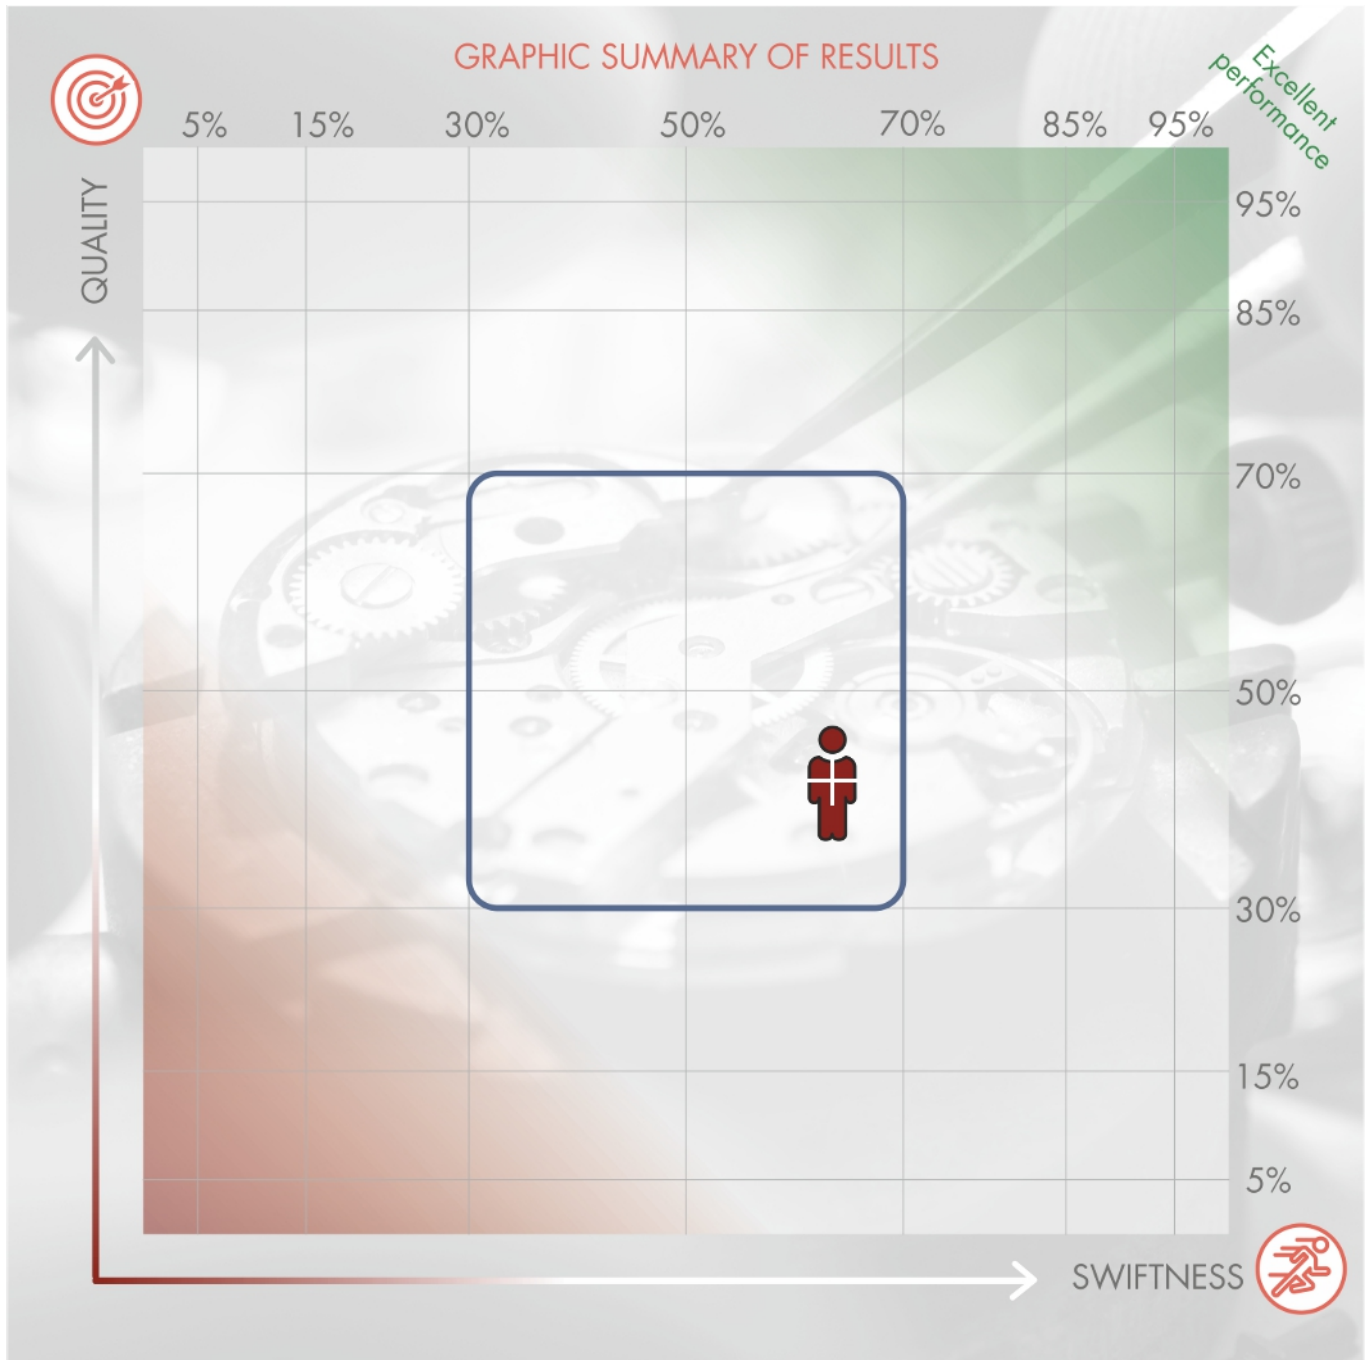

INTERPRETATION

The overall result in this test is in the zone of upper average.

The resulting level of decision-making speed ranges in the higher average zone. People with this result can concentrate well under pressure for a longer period of time and maintain a speedy work pace. In practice they will usually proceed smoothly and show a greater productivity in carrying out recurring activities.

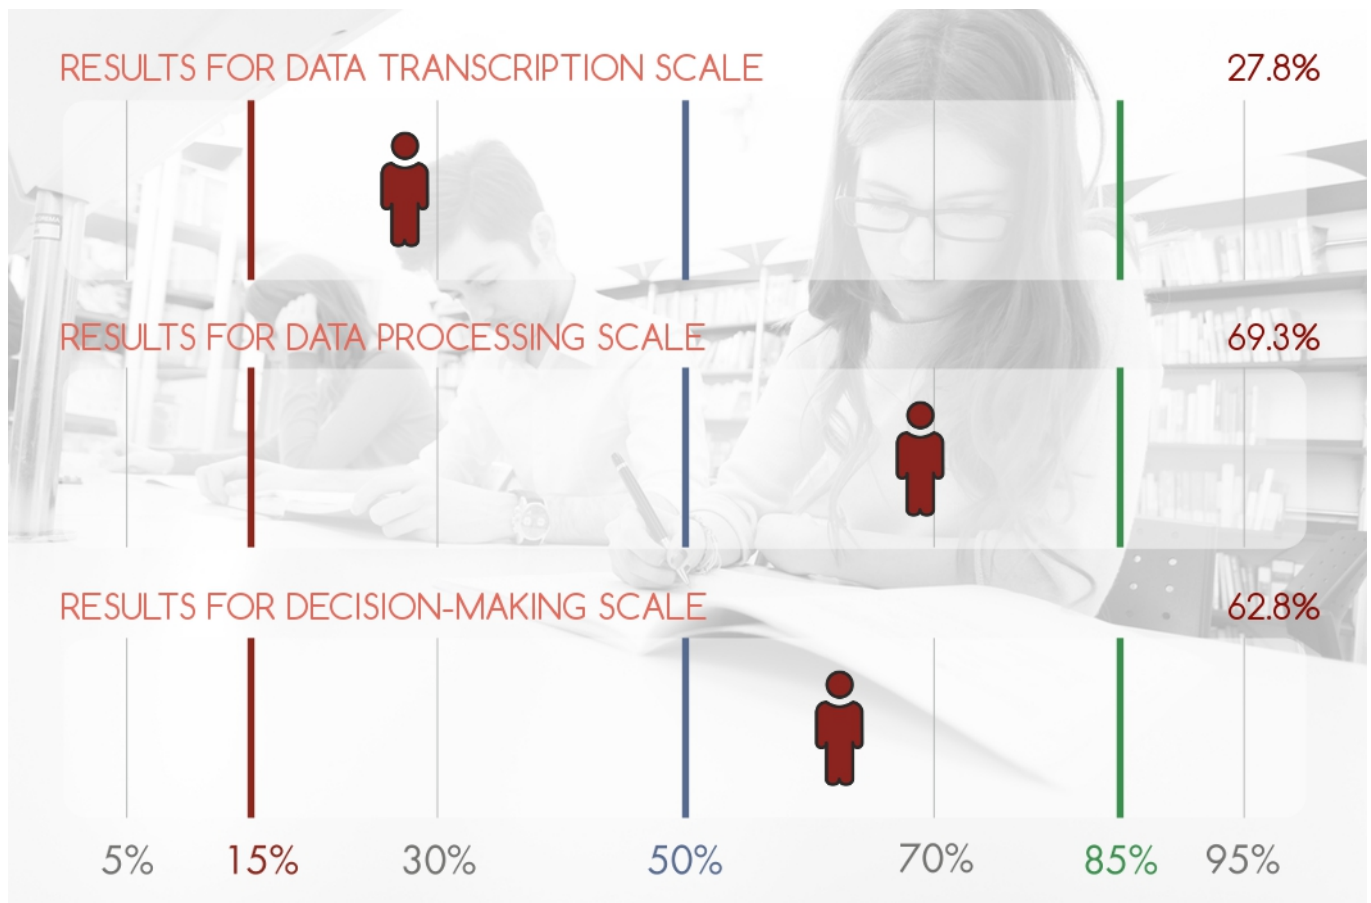

The attained results are in the lower average zone of quality of solutions. Under pressure people with these results are usually able to concentrate on their task for a longer period of time. They usually work carefully and their outputs are well elaborated. As concerns stereotypical activities, they will usually show average performance with reasonable but sometimes unstable quality.

SWIFTNESS AND QUALITY OF SOLUTIONS

Note: The chart captures the overall result attained in the test, regarding the quality and speed of solutions, in the form of percentiles.

RESULTS OF INDIVIDUAL SUBTESTS

RESULTS FOR DATA TRANSCRIPTION SCALE

The DATA TRANSCRIPTION scale measures the respondent's ability to reproduce the provided information in the form of letters.

RESULTS FOR DATA PROCESSING SCALE

The DATA PROCESSING scale measures the respondent's ability to readily find differences and predefined values in various data chains (numbers, letters, characters).

RESULTS FOR DECISION-MAKING SCALE

The DECISION-MAKING scale measures the respondent's ability to identify the key information needed for decision-making and to apply it upon selecting various options from the offer; the subtest is the most demanding as concerns both variations in the input information and the possible decision-making options.
